Who is Atat Bali?

Atat Bali (*Trichoglossus forsteni mitchellii*), also called Perkici Dada Merah or known as Mitchell's Lorikeet, is a subspecies of the Sunset lorikeet (*Trichoglossus forsteni*), **once native to Bali and Lombok.**

Nature's little pollinators – Feeding on nectar, pollen, and soft fruits with their unique bristle-tongues.

This critically endangered bird is thought to be nearly extinct in the wild. The species was last sighted in the wild in 2019, according to field observations published by Prihatmoko et al. in BirdingASIA (2019). Since then, concerns over habitat loss and population decline have prompted urgent conservation action.

How we are Tackling it

In a repatriation program with
Paradise Park UK, we've
brought home 20 Atat Bali
to Bali.

**This is part of our Fighting
Extinction program**

Building a three-generation
conservation plan to breed
and gradually release them
back into the wild.

What's Next?

After safely arriving, they are currently in **a 14-days quarantine period** before we can proceed with the upcoming sequences of our breeding program.

We are also **closely monitoring their health and condition** to assure their best wellbeing, by taking a good care of their nutritions.

Want to know more about our Atat Bali (Mitchell's Lorikeet) breeding program?

Stay tuned in our social media to find out!
